

Mimecast S1 Advanced Threat Security

Cloud-based email security service that helps to protect your organization from advanced email threats like spear-phishing and whaling.

Mimecast Targeted Threat Security is the most comprehensive cloud-based email security and compliance solution on the market today. Mimecast's massively scalable mail transfer agent (MTA) with its multiple layers of malware and spam protection acts as your email bridgehead in the cloud, stopping known and emerging email borne threats before they reach your network.

Granular and flexible email content and secure communication policies can be created and applied to outbound traffic in real-time.

How it works

Simple to deploy, simple to manage

- Switch corporate MX records to point to the Mimecast cloud platform
- Route all outbound traffic through the Mimecast platform
- Suspicious connections are dropped
- Multiple signature-based malware inspection is performed
- Zero-hour threat analysis performed to identify emerging threats
- Messages found to contain malware are automatically rejected prior to receipt
- Message content filtering is applied to further reduce unwanted emails
- Policy-based email content, attachment and image filtering performed
- All inbound URLs re-written and scanned in real-time on click
- Sandbox or safely convert files to protect against weaponized attachments
- Detect impersonation threats in email like whaling or tax fraud
- Graymail is tagged and moved out of the end users' inboxes

KEY BENEFITS:

- Mitigates risk of spear-phishing and advanced threats in email
- Protects employees against social engineering and impersonation attacks, like whaling
- Neutralizes threats from weaponized attachments and malicious file content
- Removes the graymail burden for end users
- Enables effortless email encryption and secure delivery
- Interactive digests from Outlook
- Self-service quarantine
- User invoked secure communication

Mimecast Email Security Always-on security

Anti-spam and anti-virus protection, data leak prevention, URL re-writing and graymail control are all delivered as part of a single unified solution. Mimecast's team of skilled threat intelligence experts, and advanced email security technology, ensures that you remain protected against the latest threats. Once in place, Mimecast will secure your users' inboxes, protect them from spear-phishing and manage their graymail, leaving you to focus on delivering core business services.

Advanced threat protection

Mimecast's massively scalable email security gateway is built on our proprietary MimeOS cloud platform. Email related threats such as malware, spam, spear-phishing attacks, and denial of service are all stopped before they reach your network. This reduces risk to your employees and improves the performance of your email server.

Mimecast's Targeted Threat protection mitigates the risk of spear-phishing and targeted attacks in email. Every URL in all inbound emails is re-written, to point to Mimecast's threat intelligence cloud, so users clicking on malicious or spearphishing sites are prevented from accessing damaging content or malware sites.

Email attachments can be pre-emptively scanned in a secure sandbox or converted to threat-less file formats, in order to protect against weaponized attachments, macro threats and malicious content.

End users are equally protected from social engineering and email impersonation attacks, with a sophisticated set of security checks that protect against whaling and tax fraud. End users can be alerted to suspicious emails to prevent financial loss.

End user self-service

Should the occasional message be accidentally quarantined, end user self-service facilities from within Outlook and mobile apps makes retrieving messages simple, and minimizes help desk calls. Self-learning technology and personal block and permit lists ensure that similar messages are handled appropriately in the future.

Mimecast Email Security - Key Features

Secure Email Gateway

MimeOS cloud security platform
Centrally administered via single, web-based administration console
Mimecast Personal Portal for user access
Scalable, multi-tenant cloud infrastructure backed by 100% service availability SLA
Automated synchronization with company Active Directory for policy and access control
Monitoring dashboard for email queues and services, with SMS and email alerting
Advanced routing capability, supporting real-time view of all SMTP connections and rejections.
Detailed transmission data for every email that is processed by Mimecast
Advanced threat protection
Multi-layered malware protection against known and zero-day threats
URL re-writing of all links in emails, with on-click security pre-scan to protect end users from spear-phishing
Pre-emptive attachment sandboxing to protect against weaponized attachments
Attachment file conversion, strips out active code to remove macro threats
Protect against social engineering and impersonation attacks with sophisticated anti-whaling protection
Comprehensive connection-based and content-based spam and phishing protection
Personal permit and block lists to fine tune spam preferences and end user email digests for personal quarantine management
SLAs: 100% virus protection; 99% spam protection; 0.0001% spam false positives

Make Email Safer for Business

Mimecast integrated service bundles deliver the ultimate in cyber security, resiliency and archiving. Get comprehensive risk management or address specific requirements - all in a single platform.
